Introduction

Projecting population growth for periods longer than 10 years is with great uncertainty as variables of interest remain unknown and unstable. Nevertheless, an estimate of the population's long term potential growth rate is central to many policy areas. Making population projections for Aruba has proven its difficulty as it is highly dependent on the irregular international migration. History shows that changes in the population of Aruba are mostly a reflection of the migration to and from the island depending on both the national and neighboring economic, social and political conditions. Past trends show fertility and mortality at a fairly constant level, making their role when making population projections barely significant. The number of persons leaving the island however is the most uncertain statistics to be dealt with for both population estimates as for population projections. Many of the persons leaving the island do not de-register from the Population Registry making assumptions on migration trends less certain. This report updates the population projections released in May 2012, taking into account adjustments in the labor participation rates due to the raise of the pension age to 65 years as of January 2015 and more recent migratory trends. It covers the period 2010 to 2030 using the same methodology and model as in the Population Projections series 2003-2023. This document highlights some characteristics of Aruba's projected population. The methodology is explained in the paper entitled 'Population Projections Aruba 2010-2030', published in May 2012.

Assumptions

Baseline population

In its policy brief 'Understanding and using population projections', the PBR explains the uncertainties in projecting future population and the use of less accurate assumptions regarding fertility, mortality and migration patterns. It states that 'in short-term projections, inaccuracies in the population data at the beginning point of a projection are the main source of error. For long-term projections, assumptions about future fertility, mortality and migration trends have a greater effect on accuracy.'

The intercensal population estimates are based on the 2010 Census and flow data (births, deaths and migration) recorded at the Population Registry Office. The disadvantage of these population estimates to project future population size is that the recorded departures reflect a lower emigration rate than what it actually is as people leave the island without de-registering.

The baseline population therefore is the population as counted during the 2010 Census.

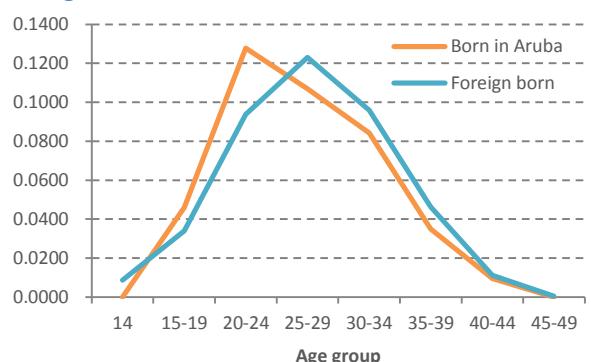

Fertility

The Total Fertility Rate (TFR) hovers around replacement level, dropping from 2.28 in 1991 to 2.04 during the 2000 Census and 2.07 during the 2010 Census. There is little difference in the TFR of women born in Aruba and those born elsewhere. As shown in figure 1, the main difference is that women born in Aruba have their children at a relatively younger age. The projection assumes the 2010 fertility results.

Table 1. Population by place of birth, age and sex 2010

Age	Born in Aruba		Foreign born	
	Male	Female	Male	Female
0-4	3,126	3,034	203	150
5-9	3,168	3,048	432	396
10-14	3,221	3,055	581	646
15-19	2,790	2,573	987	955
20-24	1,735	1,558	993	998
25-29	1,608	1,712	946	1,214
30-34	1,612	1,687	1,292	1,814
35-39	1,740	1,749	1,770	2,213
40-44	1,877	1,882	1,953	2,554
45-49	2,495	2,523	1,861	2,369
50-54	2,566	2,624	1,314	1,905
55-59	2,256	2,266	943	1,430
60-64	1,719	1,869	628	917
65-69	1,348	1,467	372	552

75-79	603	856	208	307
80-84	228	420	183	263
85-89	91	176	80	150
90-94	30	87	26	74
95+	4	23	10	37
Total	33,169	33,858	15,073	19,385

Figure 1. Age-specific fertility schedule for local and foreign-born women

Life expectancy

In 1991, life expectancy was 71.1 years for men and 77.1 for women. Based on the results of the 2010 Population and Housing Census, the number of deaths registered at the Population Registry Office, the Public Health Department and the General Social Health Insurance (AZV), life expectancy in 2010 is 73.9 for men and 79.8 for women. Notwithstanding the increase in life expectancy, it is not of much significance when making the population projections. Mortality rate is maintained at a constant level during the projections.

Migration

Assumptions for the distribution of duration of stay of foreign-born migrants were gathered from the Population Registry Office for those for whom data on the date of registry was available². The duration of stay was calculated for two periods, 1999-2001 and 2009-2013. In both these periods, more than 50 percent of departing foreign-born persons stayed less than 5 years on Aruba. However, figure 3 shows a clear shift in the period 2009-2013 towards a shorter stay on the island, when a relatively larger group of foreign-born persons stayed less than 2 years. Interesting to note is that there is almost no change in age distribution of those leaving, more than 85 percent being younger than 50 years of age. As with the assumptions in 2012, there is no recent information on the number of dependents and therefore, this number is kept constant at .33 persons per migrant as reported in the Aruba Migration and Integration Study 2003.

Labor Participation rates

As of January 1, 2015 the pension age will be raised to 60.5 years. The retirement age will continue to rise in subsequent years by six months until January 1, 2024 when the official retirement age reaches 65 years. Participation rates as calculated during the 2010 Census were therefore revised according to the scheme of adjustment of the retirement age. Participation rates for males born in Aruba in the age-group 60-64 years is calculated to increase from 39.1 (2010 Census) to an estimated 59.5 in 2015, to 81.6 in 2020 and onwards. For the foreign-born males the participation rate stood at 68.3 during the 2010 Census and is estimated to increase to 77.9 in 2015 and 89.4 in 2020 and 2025. Females on the other hand show a more dramatic increase in their participation rates. Women born in Aruba had a participation rate of 27.7 during the 2010 Census which increases to 44.4 in 2015 and to 68.3 in 2020 and onwards. Where Foreign-born women are concerned, their participation rate increases from 49.2 in 2010 to 59.7 in 2015 and 75.5 in 2020 and 2025.

Figure 2. Age-specific life expectancy 2010

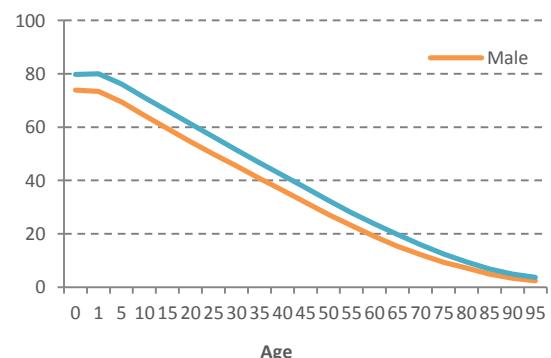

Figure 3. Departure of foreign-born population by duration of stay

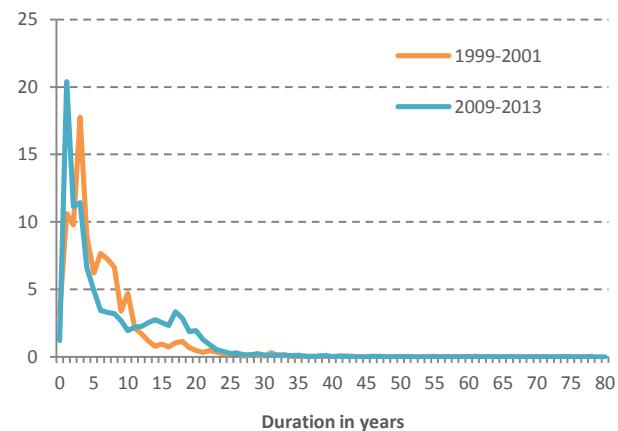

Figure 4 Male labor force participation by place of birth and age

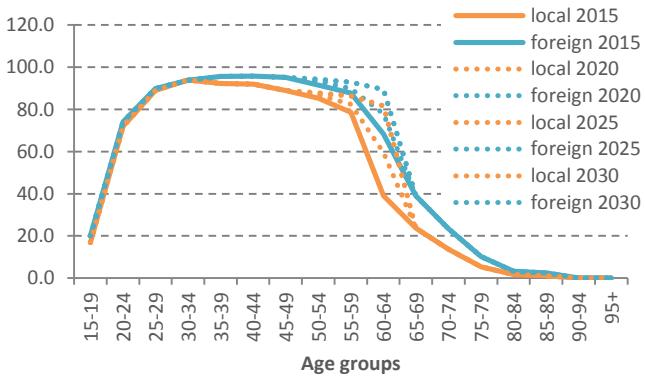

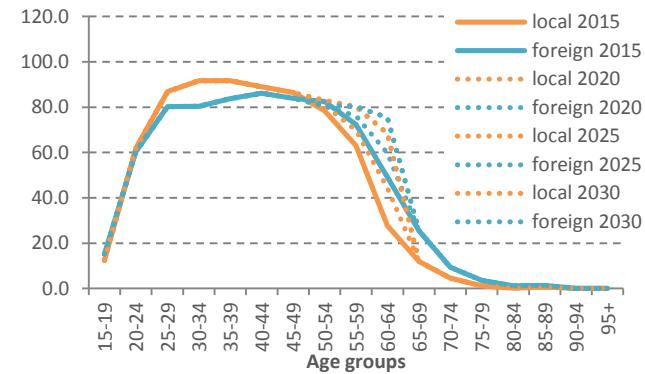

Figure 5 Female labor force participation by place of birth and age

Economic assumptions

The projection model developed in 2003 and used again in 2010 is based on the relationship between the Gross Domestic Product (GDP), labor productivity, labor force requirements and net migration. In this current revision of the population projections, the economic assumptions are kept as published in the original 2012 paper. However, the baseline GDP is set at AWG. 3,105 million with the assumption of a decreasing growth over the next twenty years. Labor productivity as of the 2010 census was at 66,740 which growth is kept at zero except for the low scenario. The labor force is adjusted to the 2010 Census results where the total labor force counted 52,037 persons and the employed population 46,524 persons. As with the 2012 assumption, the unemployment rate is expected to go down in the years to come.

Table 2. Assumptions population projection 2010 - 2030

	2010 - 2015	2015-2020	2020-2025	2025-2030
Low scenario				
Growth real GDP (%)	1.26	1.19	1.12	1.06
Growth labor productivity (%)	0.5	1	1	1
Unemployment (%)	7	5	5	5
Percentage of women in the labor force	49.8	49.8	49.8	49.8
Mid scenario				
Growth real GDP (%)	2.13	1.93	1.76	1.61
Growth labor productivity (%)	0	0	0	0
Unemployment (%)	7	6	5	5
Percentage of women in the labor force	49.8	49.8	49.8	49.8
High scenario				
Growth real GDP (%)	3.01	2.62	2.31	2.07
Growth labor productivity (%)	0	0	0	0
Unemployment (%)	7	6	5	5
Percentage of women in the labor force	49.8	49.8	49.8	49.8

A. Medium scenario

Population will grow at a slower pace

Given the economic circumstances and with no further adjustments, the population is projected to count 139,170 persons in the year 2030. However when raising the pension age to 65 years and incorporating the recent migration trends, it is estimated that the population will grow at a much slower pace than projected in 2012. The growth rate would be an average of 1.32 percentage points over the period of 20 years instead of 1.58, reaching 132,225 persons in 2030.

The gap between local and foreign-born is closing in

To keep up with the economic growth, the foreign-born population is expected to almost double in numbers by 2030. On average, the foreign-born population will grow with 2.80 percent annually versus 0.35 percent for the Aruban born population. The foreign-born accounted for about one third of the total population in 2010. By 2030 they are expected to grow to over 45 percent of the total population. With the pension age adjustments and more recent migration figures, the gap between the Aruban-born and the foreign-born population shows to be narrowing. In 2030, there will be 119 persons born in Aruba for every 100 foreign-born.

Figure 6. Projected medium scenario population, 2012 versus 2014

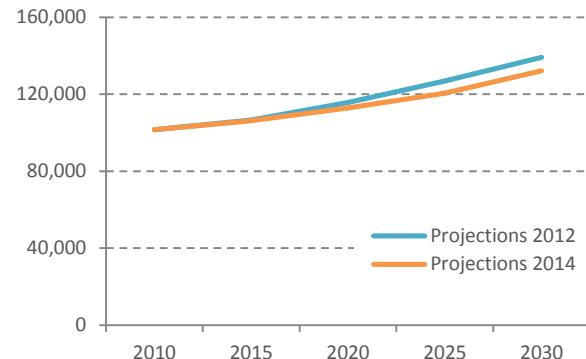

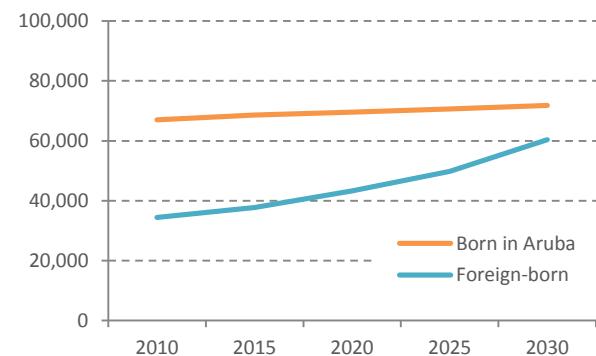

Figure 7. Population born in Aruba and foreign-born, 2010-2030

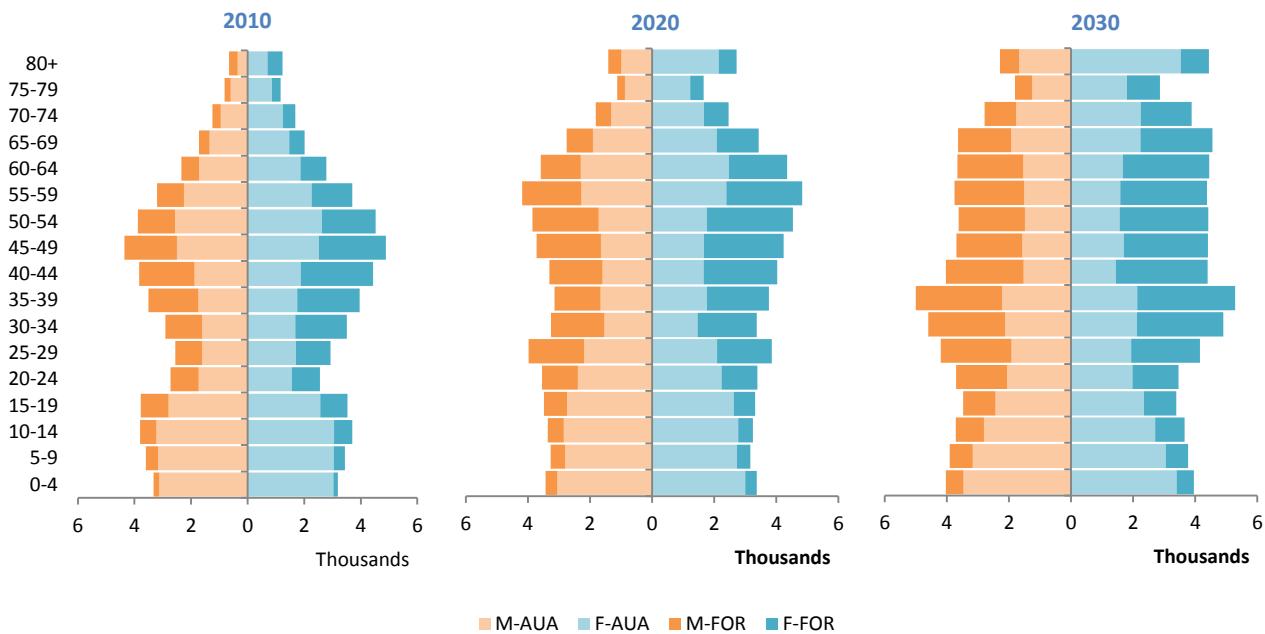

Females still outnumber males

The adjustments made to the 2012 projections only lead to a small growth for the male population. By the year 2030 there will be 88 men for every 100 women, compared to 87 men for every 100 women as projected in 2012. Despite the rise in pension age, the Aruban born male population will see no growth in numbers in the upcoming 20 years. In 2030, the sex ratio remains at about 92 Aruban-born men for every 100 Aruban-born women. Foreign-born men, on the other hand, show a small advancement in numbers. It is expected that by 2030 there will be 83 foreign-born men for every 100 foreign-born women, compared to 80 men for every 100 women as projected in 2012.

While the population is expected to grow as a whole, some particular patterns emerge within different age groups of the population. Figure 9 suggests a more uniform population distribution across the age-groups in 2030. At the same time it shows the drop in the population born in Aruba with a Dutch nationality. Even as the three largest cohorts in 2010 (5-9, 10-14 and 15-19) of those born in Aruba with a Dutch nationality move up two cohorts by 2020, still a large number of persons will be needed to fill in job vacancies. The fluctuations in numbers of those aged 15-19 and 20-24 years born in Aruba reflect the outflow of the youth pursuing further education abroad of which many do not return.

Figure 9. Population pyramid by sex, age and Aruban status, 2010-2030

Growth in the number of children and youth

The number of children aged 0-19 years is expected to drop slightly during the first ten projected years, but will eventually pick up in the following ten years. Despite increases in absolute numbers (5.4%), the number of children as a percentage of the total population show a decrease from 28 percent in 2010 to about 23 percent in 2030. The fastest growing group in absolute numbers is the group aged 0-4 years, followed by those aged 5-9 years. This increase will be mostly caused by births (by women born in Aruba as well as by foreign-born women), and expected inflows of dependents during the course of the projection period. By 2013, the foreign-born population 0-4 years will more than triple in size and the group of 5-9 years almost double.

The ageing population

It is calculated that the elderly population will still continue to grow at the same pace as projected in 2012. By 2030 the population 65 years and older will more than double in size, accounting for about 20 percent of the total population.

Further signs of ageing are seen in the old age support rate. OECD defines the old age support rate as the number of persons who are capable of providing economic support to the number of older people that may be materially dependent on the support of others. The support rate indicator is the population aged 20 to 64 years calculated as a ratio of those aged 65 years and over. In 2010, there were on average 6 persons of working age for every older person. In 2030, the rate is projected to be about 3 persons of working age for every person 65 years and older. Figure 9 shows the steady growth of the elderly population and the steady decrease of the old age support rate in the twenty years to come.

Rapid growth of the oldest old

The oldest cohort of the projected population, consisting of persons 80 years and older, shows a rapid growth in the next 20 years. In 2010, they accounted for 1.9 percent of the total population, by 2030 they will more than triple in numbers and will account for 5.1 percent of the total population.

Even as women have a higher life expectancy than men, the number of years women are expected to live in poor health are also higher than in men. In 2010, life expectancy for men was calculated at 73.88 years of which 63.25 years in good health and 10.63 years in poorer health. Women on the other hand had a life expectancy of 79.75 years of which 66.07 years in good health and 13.68 years in poorer health.

Local working age population on the decline

Given the economic assumptions for the medium scenario and keeping the current migration trends for the next twenty years, it is expected that in 2030 the Aruban born persons of working age (persons 15 years and older) will be outnumbered by foreign-born persons, especially in the most productive years (between 25 and 64 years of age). In this age category, Aruban born women, in particular, will be outnumbered by foreign-born women.

It is expected that as a result of the rapid rate at which the population is ageing, a relatively large group of individuals will be retiring over the course of these 20 years, thus creating a large number of vacant positions in the labor market. However, the ageing of the population in itself combined with the current outmigration trend of the locally available youngsters, will probably create a situation where the number of locally available potential workers will not be enough to fill all vacancies. In 2010, there were 200 persons younger than 15 years for every 100 persons older than 65 years. By the year 2030 this rate will decrease to 88 persons younger than 15 years per 100 elderly.

Figure 10. Old age support rate and absolute number of elderly and 20-64 years

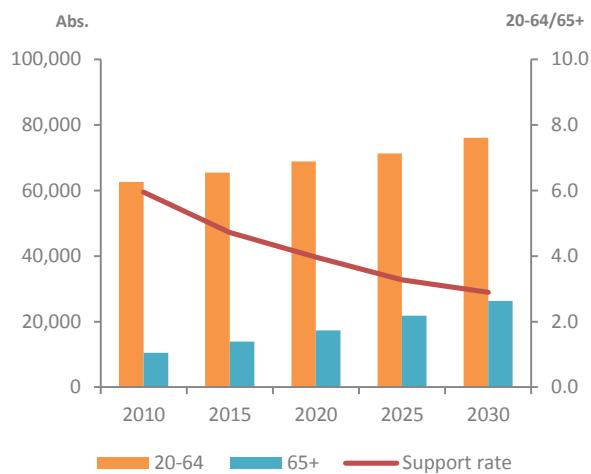

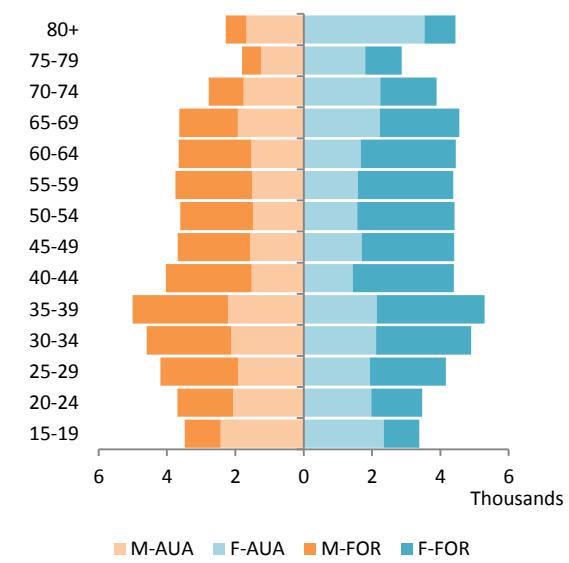

Figure 11. Population pyramid working age group by Aruban status

B. Low scenario

In the low scenario, a slower growing economy, combined with the assumption of an increasing labor productivity and lower unemployment rate, results in a negative growth of the population of 1.6 percent in the first 10 projected years. By 2030, the population would increase again.

Given the economic assumptions, the locally available youngsters and unemployed persons would suffice for filling the vacant positions created by retiring workers, thus minimizing the need for foreign-born workers and their dependents.

The high influx of immigrants in the medium scenario projection somewhat camouflages the ageing of the population. In the medium scenario the group of persons aged 65 years and older is expected to grow to 19.9 per 100 by the year 2030. In the low scenario, where the influx of migrants is considerably less, about a quarter of the population will be 65 years and older.

On the other hand, the number of children under age 15 years will decrease from 21,061 (20.8% of the total population) to 16,563 (16.1% of the total population). In both the medium and the low scenario, children will be outnumbered by those aged 65 years and older. In the low scenario however this gap becomes even larger. The dependency ratio in the low scenario will shift from 45.2 children and elderly per 100 persons in the population of working age in 2010 to 68.7 in 2030. The dependency ratio in the low scenario is much higher than in the medium scenario, where in 2030 the dependency ratio would stand at 59.4 children and elderly per 100 persons in the population of working age. The higher the dependency ratio the greater the weight that the economically active population and the overall economy faces to support and provide for the social services needed by children and elderly.

Figure 12. Projected low scenario population, 2012 versus 2014

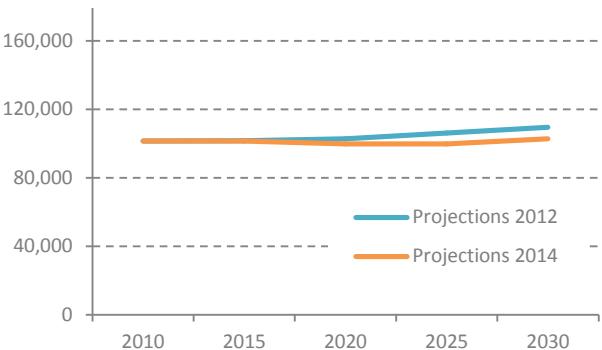

Figure 13. Total, young age and old age dependency ratio, 2010-2030

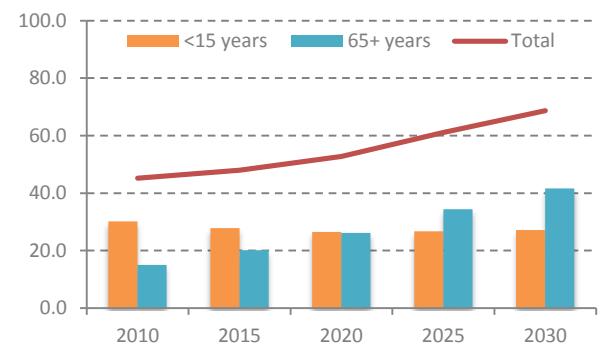

Figure 14. Population born in Aruba and foreign-born, 2010-2030

C. High scenario

For the high scenario only the growth in GDP was adjusted to a much higher growth than in the medium scenario. This growth in GDP will cause the population to grow from 101,484 persons in 2010 to 146,674 in 2030. And the most of this growth is caused by a very large inflow of migrants. The group of foreign-born persons is expected to more than double in the next 20 years, if we may experience this high economic growth with a zero growth in labor productivity. The population born in Aruba will grow much less in numbers, increasing to 73,777 persons in 2030 compared to 67,026 persons in 2010.

This high influx of immigrants in the high scenario projection camouflages the ageing of the population even more than in the medium scenario. In the high scenario, the group of persons aged 65 years and older is expected to grow to 18.3 per 100 by the year 2030, compared to 19.9 in 2030 in the medium scenario.

With more women in their reproductive years, the number of children under age 15 is expected to grow during this 20 year projection period from 21,061 in 2010 to 25,813 in 2030. Still, they will be only 17.6 percent of the total population, about the same as in the medium scenario, where children under age 15 represented 17.4 percent of the total population. In the high scenario, children will be outnumbered by those aged 65 years and older, but only by a small number.

In 2030, the group of persons aged 65 years and older will be 2.5 times larger than in 2010. The dependency ratio will increase from 45.2 children and elderly per 100 persons in the population of working age in 2010 to 56.0 in 2030. The dependency ration in the high scenario is lower than in the medium scenario, where in 2030 the dependency ratio will be 59.4 children and elderly per 100 persons in the population of working age. This difference is caused by the relatively larger population of working age in the high scenario, increasing from 69,896 persons in 2010 to 94,008 in 2030.

Figure 15. Projected high scenario population, 2012 versus 2014

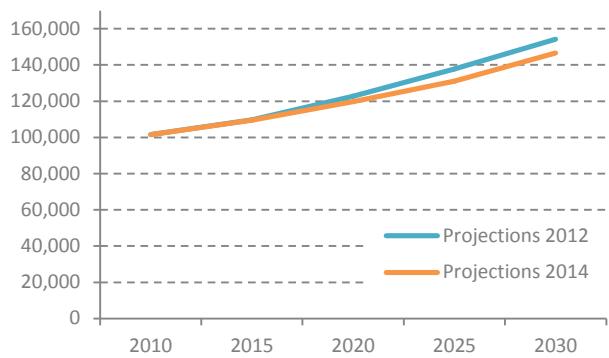

Figure 16. Total, young age and old age dependency ratio, 2010-2030

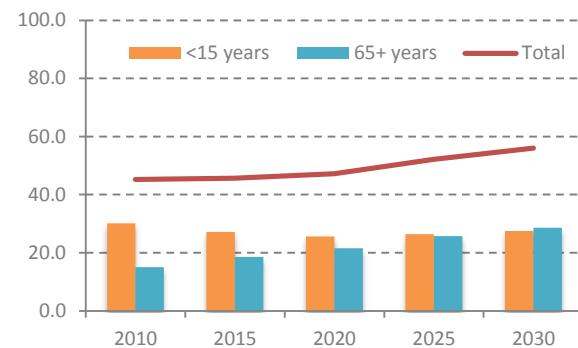

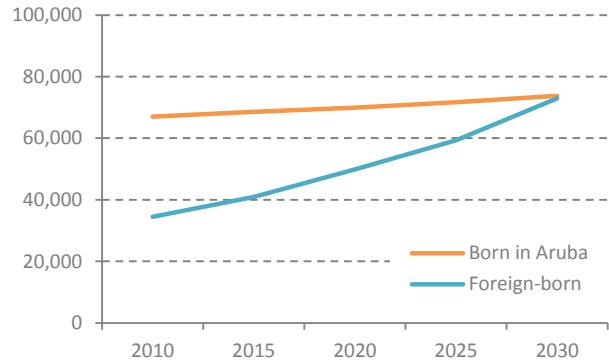

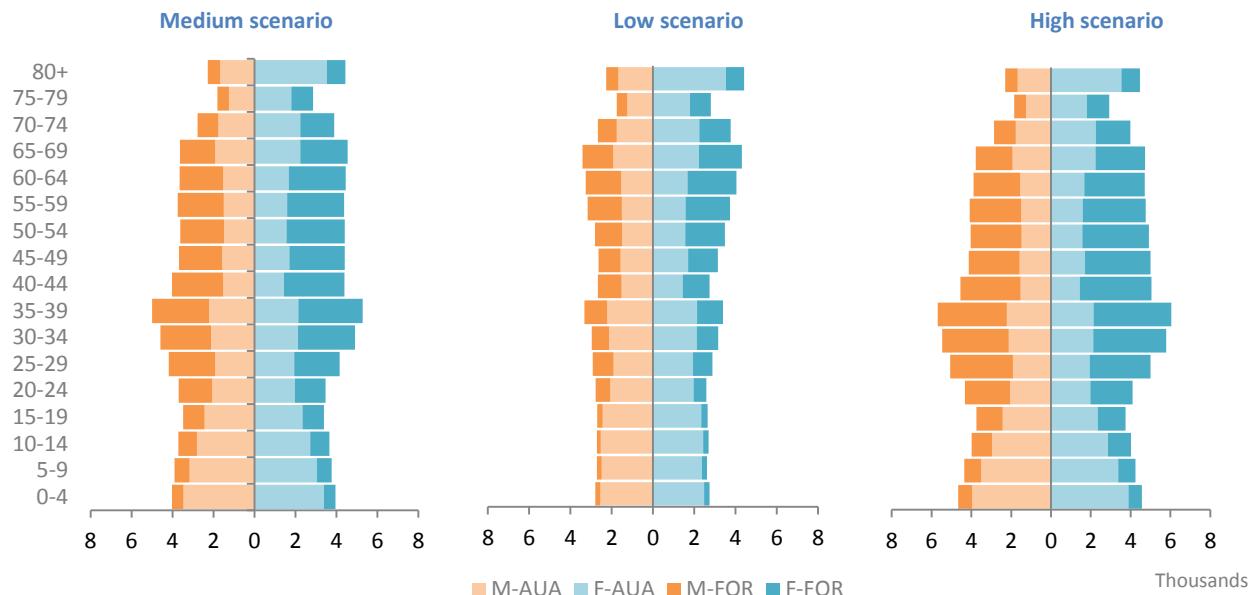

Figure 17. Population born in Aruba and foreign-born, 2010-2030

D. Conclusion

Figure 18. Population pyramid by sex, age and Aruban status, 2030

In all three scenarios it is clear that the Aruban-born population is ageing and that it will take a couple of years to recover in numbers if the current migration pattern is to be followed. A lower GDP growth rate, higher labor productivity and decreasing unemployment as assumed in the low scenario, would reduce the need to import foreign workers. On the other hand with no growth in the reproductive age groups, the number of births would not suffice in times of high economic growth. High economic growth would trigger a much larger foreign-born population until the population born in Aruba eventually recovers.

In 2020, we see a dramatic increase in the proportion of elderly, which ultimately settles at about 13 percent by 2025 and 2030. However, in absolute numbers, the population aged 65 years and older will grow at a constant and very fast pace. They will more than double in numbers during the next twenty years for all scenario's.

Still at age 65, men in Aruba are expected to live an average of 15.31 more years, of which 10.09 years in good health and 5.22 years in bad health. Women at age 65 are expected to live an average of 19.71 more years, 12.58 years in good health and 7.13 years in bad health. So the population is to be expected to live an average of 75 years in good health. Therefore it is important to note that the group of persons aged 75 years and older will almost triple in size in the projected twenty years in all three scenario's.
